

Description

The Immunization Registry returns an Evaluated History and Forecast (Z42) to the EMR in response to the query for patient (Juana Mariana Gonzales). The provider reviews the immunization history from the registry and compares to the immunization history in the EMR. The provider reconciles the information from these sources, importing information known only to the registry, retaining information that is more accurately reflected in the local EMR:

The physician accesses the record for Juana Mariana Gonzales and:

- ◆◆◆ Reconciles the EHR vaccine history with the history retrieved from the registry:
- o Accepts new vaccines from the registry data
- o If the EHR does not already flag the first MMRV as invalid, the provider updates the first MMRV to indicate it is "invalid" as it was given too early (as notified by the registry)
- o Retains the local history for influenza and polio vaccines that are not included in the registry report.

Comments

No Comments

Pre Condition

Juana Mariana Gonzales Initial Data Load is completed.

Juana Mariana Gonzales is the active working patient in the EMR.

A Z44 query has been submitted to the Immunization Registry and a Z42 response is provided back to the EMR.

Post Condition

Evaluated Immunization History returned from the registry is reconciled and imported into the patient record (Juana Mariana Gonzales)

Test Objectives

Real Time Request/Receive Patient Immunization History: The system sends a request to the public health immunization registry "on demand" (e.g., those without scheduled appointments). The request includes the identifying information the immunization registry needs to match each patient with those in the registry including, if present, the mother's maiden name, a multiple birth indicator, and the birth order. The request also is sent in a pre-determined format the registry can read and interpret (Query Response Grammar (RSP) - HL7 version 2.5.1 Implementation Guide for Immunization Messaging Release 1.5).

Compare Public Health Immunization Registry (IIS) Immunization History to EHR Immunization History: The public health immunization registry has returned the requested immunization history for a patient. The EHR is able to display the immunization history received from the registry as well as the immunization history already present in the EHR so that a user can compare them. The EHR provides a way for the provider to view both histories, determine what is different (if anything), and update the existing EHR immunization history with new information from the public health registry if he or she chooses to do so. The system must store the new information as structured data as part of the patient's local immunization history and include the time of the update and the source of the new information.

Review Patient Immunization History: To assist with the ordering process, the EHR or other clinical software system allows a user to specify standard views of patient immunization information for each vaccine dose administration, including patient-specific data (e.g., age on dates of administration, etc.).

Evaluation Criteria

1. The EMR is able to receive the response from the Immunization Registry

1. The EMR is able to receive the response from the Immunization Registry.
2. The EMR displays the information returned from the Immunization Registry according to the Juror Document.
